

Volume 27 - Legacy Seed Analysis

Version v128 draft

README.md

Volume 27 - Legacy Seed Analysis

Title: Volume 27 - Legacy Seed Analysis

Version: v128 draft

Status: Draft

Document ID: MAL-V27-README

Purpose

Volume 27 captures safe historical seed patterns from the old ai-business-os material and maps them into Mariam Architecture Library as Legacy Seed Integration. It is not a code migration volume.

Scope

- Extracts CRM Workspace, Sales Pipeline, AI Agent Chat, Memory JSON Pattern, WebSocket Live Metrics, Service Status Panel, Mindmap / Service Graph, Docker Runtime Stack, n8n Integration Layer, Ollama Local Provider, MinIO Storage, Redis Cache, and Postgres Business DB.
- Prevents migration of secrets, passwords, SSH keys, API keys, runtime data, customer records, raw environment files, raw routes, raw schemas, and private filesystem paths.
- Provides traceable documentation for future documentation-driven rebuild work.

Source Handling

The available historical source in this workspace is attachment text rather than a complete raw code archive. The analysis therefore captures product and infrastructure patterns as safe architecture seeds.

Volume 27 - Legacy Seed Analysis Changelog

v128 Entries

Date	Version	Status	Summary
2026-06-30	v128 draft	Draft	Added safe legacy seed analysis for 13 ai-business-os systems and security exclusions.

Volume 27 - Legacy Seed Analysis Traceability

Legacy Seed Trace Map

Legacy Seed	Mariam Target
CRM Workspace	Volume 26, Volume 25, Volume 06
Sales Pipeline	Volume 25, Volume 27, Volume 06
AI Agent Chat	Volume 11, Volume 18, Volume 26
Memory JSON Pattern	Volume 12, Volume 06, Volume 27
WebSocket Live Metrics	Volume 21, Volume 22, Volume 26
Service Status Panel	Volume 21, Volume 26
Mindmap / Service Graph	Volume 03, Volume 21, Volume 26
Docker Runtime Stack	Volume 08, Volume 21
n8n Integration Layer	Volume 06 Integration, Volume 15 Runtime Ecosystem
Ollama Local Provider	Volume 16 Model Ecosystem, Volume 06 Provider Specifications
MinIO Storage	Volume 21 Infrastructure, Volume 06 Storage Specifications
Redis Cache	Volume 21 Infrastructure
Postgres Business DB	Volume 21 Infrastructure, Volume 25 Autonomous Enterprise

Security Trace

All extracted seeds pass through legacy-27-99-security-exclusions.md before they can become implementation tasks.

Volume 27 - Legacy Seed Analysis Acceptance

v128 Acceptance Checklist

- Volume 27 contains safe analysis for all 13 requested ai-business-os systems.
- No secrets, passwords, SSH keys, tokens, raw .env files, database URLs, runtime dumps, customer data, or local private paths are copied.
- Each system is mapped to Mariam integration targets and future documentation-driven rebuild boundaries.
- Security exclusions are documented in a dedicated file.
- PDF Volume_27_Legacy_Seed_Analysis_v128_draft.pdf is generated and readable.
- ZIP Mariam_Architecture_Library_v128_draft.zip contains Volume 27 Markdown, all PDFs, MANIFEST, and release notes.

CRM Workspace

Title: CRM Workspace

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-01

Purpose

Document the safe legacy seed extracted from ai-business-os for the customer relationship workspace for accounts, contacts, conversations, opportunities, client state, follow-up, and delivery context. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed preserved the business-operating-system idea: client relationship, opportunities, proposal, follow-up, and delivery state belong in the product surface.
- Mariam should keep the workspace and pipeline model as first-class enterprise screens connected to communications, approvals, and delivery.
- No customer records, lead data, proposals, or conversation transcripts are copied.

Extracted Pattern

- Treat CRM Workspace as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Experience Interface Design
- Autonomous Enterprise
- Communications Hub
- Governance
- Postgres Business DB
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys

- Postgres credentials
- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

Acceptance Criteria

- The document describes a reusable system pattern from ai-business-os without transferring unsafe implementation details.
- The integration target maps cleanly to existing Mariam volumes.
- Security exclusions are explicit and testable.
- Future code work can be planned from this document only after corresponding Specifications and implementation tickets are created.

Traceability

Source	Relationship
ai-business-os historical attachment	Legacy seed source; read-only and sanitized.
MAL-V27-LEGACY-01	Safe v128 analysis of CRM Workspace.
Volume 26 Experience & Interface Design	UI and dashboard integration reference.
Volume 06 Specifications	Implementation boundary reference.
Volume 21 Infrastructure	Runtime stack and operations reference where applicable.

Version History

Version	Date	Status	Notes
v128 draft	2026-06-30	Draft	Added safe legacy seed analysis for CRM Workspace.

Sales Pipeline

Title: Sales Pipeline

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-02

Purpose

Document the safe legacy seed extracted from ai-business-os for the pipeline model for leads, proposals, negotiations, approvals, won work, lost work, and post-sale delivery transitions. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed preserved the business-operating-system idea: client relationship, opportunities, proposal, follow-up, and delivery state belong in the product surface.
- Mariam should keep the workspace and pipeline model as first-class enterprise screens connected to communications, approvals, and delivery.
- No customer records, lead data, proposals, or conversation transcripts are copied.

Extracted Pattern

- Treat Sales Pipeline as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Experience Interface Design
- Autonomous Enterprise
- Communications Hub
- Governance
- Postgres Business DB
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys

- Postgres credentials
- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

Acceptance Criteria

- The document describes a reusable system pattern from ai-business-os without transferring unsafe implementation details.
- The integration target maps cleanly to existing Mariam volumes.
- Security exclusions are explicit and testable.
- Future code work can be planned from this document only after corresponding Specifications and implementation tickets are created.

AI Agent Chat

Title: AI Agent Chat

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-03

Purpose

Document the safe legacy seed extracted from ai-business-os for the execution chat pattern where agents, chief, reviewers, and operators coordinate work through traceable conversations. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified AI Agent Chat as an important operational pattern for an AI business operating system.
- Mariam should preserve the system role, user-facing behavior, integration points, state model, and acceptance criteria.
- No source code, runtime routes, secrets, data dumps, or implementation-specific identifiers are copied.

Extracted Pattern

- Treat AI Agent Chat as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Experience Interface Design
- Execution OS
- Monitoring
- Governance
- Architecture Library
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys
- Postgres credentials

- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

Acceptance Criteria

- The document describes a reusable system pattern from ai-business-os without transferring unsafe implementation details.
- The integration target maps cleanly to existing Mariam volumes.
- Security exclusions are explicit and testable.
- Future code work can be planned from this document only after corresponding Specifications and implementation tickets are created.

Memory JSON Pattern

Title: Memory JSON Pattern

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-04

Purpose

Document the safe legacy seed extracted from ai-business-os for the structured memory record pattern for agent context, customer facts, decisions, preferences, and operational state. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed used structured JSON-like memory as a portable state pattern rather than opaque chat history.
- Mariam should preserve the pattern as a governed Memory Record with schema, owner, scope, expiry, provenance, confidence, and redaction fields.
- Raw historical memory content is not copied; only the structural pattern is retained.

Extracted Pattern

- Treat Memory JSON Pattern as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Memory Store
- Agent Chat
- CRM Workspace
- Knowledge Center
- Audit Log
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys
- Postgres credentials

- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

Acceptance Criteria

- The document describes a reusable system pattern from ai-business-os without transferring unsafe implementation details.
- The integration target maps cleanly to existing Mariam volumes.
- Security exclusions are explicit and testable.
- Future code work can be planned from this document only after corresponding Specifications and implementation tickets are created.

WebSocket Live Metrics

Title: WebSocket Live Metrics

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-05

Purpose

Document the safe legacy seed extracted from ai-business-os for the live operational metric stream for dashboards, job progress, service health, and execution telemetry. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation- specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed suggested live dashboard metrics streamed to the interface for service status and operational progress.
- Mariam should represent this as a Live Metrics Channel with authenticated subscriptions and filtered event topics.
- No runtime event payloads or production telemetry values are copied.

Extracted Pattern

- Treat WebSocket Live Metrics as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Monitoring Center
- Service Status Panel
- Execution OS
- Event Bus
- Dashboard
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys

- Postgres credentials
- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

Acceptance Criteria

- The document describes a reusable system pattern from ai-business-os without transferring unsafe implementation details.
- The integration target maps cleanly to existing Mariam volumes.
- Security exclusions are explicit and testable.
- Future code work can be planned from this document only after corresponding Specifications and implementation tickets are created.

Service Status Panel

Title: Service Status Panel

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-06

Purpose

Document the safe legacy seed extracted from ai-business-os for the visible service health panel for runtime services, providers, databases, queues, workers, and integrations. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified Service Status Panel as an important operational pattern for an AI business operating system.
- Mariam should preserve the system role, user-facing behavior, integration points, state model, and acceptance criteria.
- No source code, runtime routes, secrets, data dumps, or implementation-specific identifiers are copied.

Extracted Pattern

- Treat Service Status Panel as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Experience Interface Design
- Execution OS
- Monitoring
- Governance
- Architecture Library
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens

Mindmap / Service Graph

Title: Mindmap / Service Graph

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-07

Purpose

Document the safe legacy seed extracted from ai-business-os for the graph-style view of services, agents, dependencies, workflows, runtime objects, and operational relationships. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified Mindmap / Service Graph as an important operational pattern for an AI business operating system.
- Mariam should preserve the system role, user-facing behavior, integration points, state model, and acceptance criteria.
- No source code, runtime routes, secrets, data dumps, or implementation-specific identifiers are copied.

Extracted Pattern

- Treat Mindmap / Service Graph as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Experience Interface Design
- Execution OS
- Monitoring
- Governance
- Architecture Library
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys

- Postgres credentials
- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

Acceptance Criteria

- The document describes a reusable system pattern from ai-business-os without transferring unsafe implementation details.
- The integration target maps cleanly to existing Mariam volumes.
- Security exclusions are explicit and testable.
- Future code work can be planned from this document only after corresponding Specifications and implementation tickets are created.

Traceability

Docker Runtime Stack

Title: Docker Runtime Stack

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-08

Purpose

Document the safe legacy seed extracted from ai-business-os for the containerized runtime stack pattern for local services, application runtime, databases, queues, object storage, and automation services. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed showed an operating stack mindset where application, automation, model, storage, cache, and database services run together locally.
- Mariam should keep this as a deployment pattern and not as a hard-coded production topology.
- No docker-compose secrets, volumes, runtime paths, or credentials are copied.

Extracted Pattern

- Treat Docker Runtime Stack as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Operations Guide
- Infrastructure
- Runtime Ecosystem
- Storage
- Monitoring
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys
- Postgres credentials

- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

Acceptance Criteria

- The document describes a reusable system pattern from ai-business-os without transferring unsafe implementation details.
- The integration target maps cleanly to existing Mariam volumes.
- Security exclusions are explicit and testable.
- Future code work can be planned from this document only after corresponding Specifications and implementation tickets are created.

n8n Integration Layer

Title: n8n Integration Layer

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-09

Purpose

Document the safe legacy seed extracted from ai-business-os for the workflow automation integration layer for external triggers, scheduled jobs, webhook actions, and business process handoffs. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified n8n Integration Layer as a practical infrastructure or integration capability.
- Mariam should keep the architectural role, adapter boundary, health state, and governance requirements.
- No credentials, connection strings, local volumes, or runtime data are copied.

Extracted Pattern

- Treat n8n Integration Layer as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Runtime Ecosystem

- Connector Runtime
- Provider Runtime
- Infrastructure
- Operations Guide
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

Ollama Local Provider

Title: Ollama Local Provider

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-10

Purpose

Document the safe legacy seed extracted from ai-business-os for the local model provider pattern for offline or private LLM execution through a provider abstraction. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation- specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified Ollama Local Provider as a practical infrastructure or integration capability.
- Mariam should keep the architectural role, adapter boundary, health state, and governance requirements.
- No credentials, connection strings, local volumes, or runtime data are copied.

Extracted Pattern

- Treat Ollama Local Provider as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Runtime Ecosystem

- Connector Runtime
- Provider Runtime
- Infrastructure
- Operations Guide
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys
- Postgres credentials
- Redis credentials

- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw routes, raw schemas, raw Docker volumes, runtime database rows, and private local filesystem paths.

MinIO Storage

Title: MinIO Storage

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-11

Purpose

Document the safe legacy seed extracted from ai-business-os for the object storage pattern for artifacts, documents, generated files, uploads, reports, and package assets. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation- specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified MinIO Storage as a practical infrastructure or integration capability.
- Mariam should keep the architectural role, adapter boundary, health state, and governance requirements.
- No credentials, connection strings, local volumes, or runtime data are copied.

Extracted Pattern

- Treat MinIO Storage as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

Redis Cache

Title: Redis Cache

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-12

Purpose

Document the safe legacy seed extracted from ai-business-os for the cache and ephemeral coordination pattern for sessions, queues, locks, rate limits, and live dashboard state. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation- specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified Redis Cache as a practical infrastructure or integration capability.
- Mariam should keep the architectural role, adapter boundary, health state, and governance requirements.
- No credentials, connection strings, local volumes, or runtime data are copied.

Extracted Pattern

- Treat Redis Cache as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Postgres Business DB

Title: Postgres Business DB

Version: v128 draft

Status: Draft

Document ID: MAL-V27-LEGACY-13

Purpose

Document the safe legacy seed extracted from ai-business-os for the relational business database pattern for CRM, sales, accounts, jobs, proposals, audit, and operational records. This document preserves historical product and infrastructure intent while preventing unsafe migration of code, secrets, runtime data, or implementation-specific coupling.

Scope

- Captures the reusable pattern, user-facing role, integration boundary, storage implications, security constraints, and acceptance criteria.
- Applies to documentation-driven rebuild decisions in Mariam AI Enterprise OS.
- Excludes direct source code transfer, credentials, passwords, SSH material, raw runtime data, customer data, and environment files.

Legacy Evidence Summary

- Legacy seed identified Postgres Business DB as a practical infrastructure or integration capability.
- Mariam should keep the architectural role, adapter boundary, health state, and governance requirements.
- No credentials, connection strings, local volumes, or runtime data are copied.

Extracted Pattern

- Treat Postgres Business DB as a canonical capability candidate, not as copied implementation.
- Preserve the operating model: visible state, clear ownership, traceable events, auditable decisions, and dashboard-ready telemetry.
- Convert legacy naming into Mariam terminology through Canonical Dictionary alignment.
- Route all implementation through Blueprint, Specifications, Engineering Standards, and Experience Interface Design before code is written.

Mariam Integration Target

- Register the capability as a governed RuntimeObject family or interface workspace where applicable.
- Connect state changes to Event Bus, Monitoring Center, Governance & Approvals, and relevant storage systems.
- Expose status, ownership, lifecycle phase, evidence, errors, and next actions in the Command Center.
- Use adapters for external services rather than embedding vendor-specific behavior in the core.

Interfaces

- Runtime Ecosystem

- Connector Runtime
- Provider Runtime
- Infrastructure
- Operations Guide
- MANIFEST and release notes for documentation traceability.
- Security and governance review before implementation begins.

Data Model Guidance

- Define canonical IDs, owner, tenant, lifecycle state, status, timestamps, provenance, trace ID, and policy version.
- Separate durable business records from ephemeral cache or live metric state.
- Store audit evidence for decisions, approvals, failures, retries, and manual interventions.
- Use schema versioning for legacy-derived patterns so future implementation can evolve safely.

Events

- legacy.seed.identified
- legacy.seed.reviewed
- legacy.seed.accepted
- legacy.seed.rejected
- legacy.seed.security_blocked
- legacy.seed.mapped_to_mariam

Security Controls

- Do not import secrets, passwords, SSH keys, tokens, database URLs, raw environment files, or runtime data.
- Redact any copied examples until only structural placeholders remain.
- Require security review before turning this seed into implementation tasks.
- Treat legacy service names as references only; current Mariam configuration must be generated fresh.

What Was Explicitly Not Migrated

- passwords
- secrets
- API keys

Security Exclusions

Title: Security Exclusions

Version: v128 draft

Status: Draft

Document ID: MAL-V27-SECURITY-001

Purpose

Define what was intentionally blocked while extracting legacy seed patterns from ai-business-os.

Scope

This document applies to all Volume 27 legacy seed analysis and any future implementation work derived from it.

Blocked Materials

- passwords
- secrets
- API keys
- SSH private keys
- database connection strings
- runtime data dumps
- session tokens
- raw .env files
- MinIO access keys
- Postgres credentials
- Redis credentials
- n8n encryption keys
- Ollama local model paths containing user-private filesystem details
- Raw source code copied directly from old systems.
- Raw routes, schemas, runtime tables, Docker volumes, logs, object storage contents, and customer records.
- Any value that could grant access to a system, account, database, object store, cache, local model directory, workflow automation instance, or private repository.

Allowed Materials

- System names.
- Architectural roles.
- UI and workflow patterns.
- Adapter boundaries.
- Storage responsibilities.
- Event and metric categories.

- Governance and acceptance requirements.

Acceptance Criteria

- No blocked material appears in Volume 27.
- All legacy-derived systems are described as patterns and integration targets, not direct migrations.
- Any future implementation must create fresh configuration and secrets through approved secure channels.

Traceability

Source	Relationship
ai-business-os historical material	Read-only legacy source.
Volume 27	Sanitized architecture seed analysis.

Version History

Version	Date	Status	Notes
v128 draft	2026-06-30	Draft	Added security exclusions for legacy seed integration.
